

INTERVIEWEE PRAC QNS

QN 01.

Consider a database called `ajira_db.sql` stored on the desktop computer, kindly extract it to see table `employee` (with `employee_id`, `fname`, `lname`, `manager_id`) and table `employee salary` (`salary_amount`, `employee_id`, `name` from `employee`). Write SQL QUERIES TO;

1. Select employees who are also managers
2. Select employees with greater salary than the less paid employee (give a person's name)
3. Select employees with no salary
4. Calculate employees total and average salary without using the AVERAGE function
5. Select columns for employees table with duplicate and show them

NB: The `ajira_db` was given.

QN 02.

Create a program in any language of your choice to let user give their preference cadres. The program should have three cadres namely; networking, programming and system administration. Then display interviewees from each cadres, and calculate the total number of interviewees from all three cadres.

QN 03.

Given a Linux operating system and considering the above employees table:

1. Write or implement a security command to send notifications to database users from root user to change their password after every seven days, the message should be sent automatically two days prior.
2. Create a database backup daily for your users.

QN 04.

Consider a high-quality hospital near you needs an Electronic Record Health (ERH)- Management System to keep track of it's billings, medication, departments, patients details, and should be able to allow for emergency services as fast as possible, with a highly secured means. Should also be able to generate invoice.

1. Kindly name the PC specifications to run such system.
2. Show the relationship between all your things in consideration (ER-Model) for ERH-MS.
3. What are the things to take into consideration for the high performance of such system
4. What are things of interest to store or to consider for ERH-Management System.
